REZNOR® IS YOUR GLOBAL LEADER IN HVAC TECHNOLOGY

BACKGROUND

Reznor was founded in 1888 to manufacture the “Reznor” reflector heater, which used a luminous flame gas burner developed by George Reznor. This technological breakthrough was an immediate success and hastened the expansion of gas heating in residential and commercial applications. Technological development and innovation have been the hallmarks of Reznor products through the years. As a result of this pioneering role in the heating, makeup air and ventilating equipment field, the products offered today are the most advanced in engineering design to satisfy a wide variety of applications.

SERVICES

Product service requirements are handled through contractors and/or distributors, with backup from local representatives and factory-based service team. Replacement parts inventories for both warranty and non-warranty requirements are maintained at service centers throughout the country and at the manufacturing facilities.

For the Reznor Representative in your area, call 800-695-1901.

ABOUT NORTEK GLOBAL HVAC

For more than 100 years, Nortek Global HVAC has brought the latest innovations in heating, cooling and ventilation to homes, businesses and every place in between. Our vast portfolio of residential and light commercial brands offers efficient and dependable products that live up to their trusted reputation. We're always looking for the next advancement in HVAC because innovation is not only our legacy, it is our future.

In addition to Reznor product, Nortek Global HVAC and its subsidiaries build and sell HVAC systems under the Maytag®, Frigidaire®, Mammoth® and Gibson® brands, among others.

Why choose Reznor®?

With more than 130 years of experience in gas heating and air conditioning, Reznor manufactures a wide range of industrial and commercial HVAC solutions. Founded in 1888 in Pennsylvania, Reznor is a global leader thanks to its innovative and economical solutions for heating, cooling, ventilation and air quality.

WS HYDRONIC UNIT HEATER

INDOOR, SUSPENDED, STEAM OR HOT WATER FOR VERTICAL OR HORIZONTAL CONFIGURATION

Reznor® Model WS Steam/Hot Water Suspended Heaters are design-engineered to be technically advanced and esthetically pleasing which makes it the hydronic heater for the 21st century.

This smart new concept in commercial heating units will accommodate all architects who are looking for something new and different.

The heating range of Model WS is 13,000 to 350,000 BTUH. The air volume ranges from 270 to 4,750 CFM.

The heat exchanger is made of one or two rows of steel coils (standard or optional copper coils) with aluminum fins, with approximately 10-1/2 fins per inch (4 fins per cm). The spacing between the fins makes cleaning and maintenance of the heat exchanger easier, which is essential to keep the unit heater efficient.

For Hot Water Applications, the standard steel tubing (Option HA11) is very strong and long lasting. The steel tubing is 0.867" (22 mm) in diameter and 0.040" (1 mm) thick with aluminum fins. This creates a sturdy, efficient heat exchanger. Steel tubing is designed for hot water applications up to 150 psi.

For Steam Heating Applications, copper tube (Option HA12) is required. The copper tubing used for the heating coil is very thick (0.03", 0.75 mm), making Reznor heating coils extremely sturdy and long lasting. The copper tube diameter is 0.867" (22 mm) O.D. Designed for high working steam pressure up to 145 psi (10 bar), every heat exchanger is subjected to a pressure test at over 350 psi (25 bar) before leaving the factory. Copper heat exchanger systems may also be used for Hot Water applications.

The large tube diameter of Reznor hydronic heaters reduces the water pressure drop, which means these units require lower pump pressure than other hydronic heaters. It also allows a very rapid heat-up of the space.

The heat exchanger assembly receives a special epoxy-polyester powder coating which makes the coil long lasting and increases the thermal output.

The Fan/Motor Assembly is made up of three components: the fan, the motor and the fan guard, which also acts as the main support for the fan. This fan guard is galvanized for protection against corrosion, and is mounted onto the main casing with anti-vibration rubber mountings. The fan guard meets OSHA requirements.*

The standard 2-speed motor is a hermetically sealed motor which is maintenance free. The motor is wired for 115/1/60 supply voltage. The motor speed is field adjustable to run at high or low RPMs. Refer to the Technical Data Chart for fan RPM, heating output and CFM ranges.

The flexibility of changing motor speeds allows the installer to adjust the unit to high speed for increased BTUH output, or low speed for reduced noise level. All motors have internal protection as a standard feature.

All Model WS units can be installed for either vertical downflow or horizontal discharge.

The unit cabinet is manufactured from .032" (0.8mm) galvanized pre-painted steel finished in dove gray. Using pre-painted steel helps protect the cabinet against oxidation.

The cabinet is held together by shake-proof screws and molded corner sections to add additional strength and durability. Adjustable louvers are held in place by spring loaded pivots. Vertical louvers are available for field installation.

The optional Airflow Induction Optimizer is available for horizontally discharged units. The Airflow Induction Optimizer increases the airflow due to the unique shape of its deflecting louvers which improves the throw of the heated air stream. See the optional accessories section for more information.

Units are packaged into strong corrugated cardboard cartons with strengthened upper and lower side sections. These containers are clearly marked with the model number, size and approximate shipping weight.

Units are manufactured in an ISO 9001 registered facility.

* OSHA requires that the fan guard spacing for a heater mounted 7 feet off the floor cannot exceed 1/2 inch.

REZNOR®

STANDARD FEATURES

- Heat exchanger composed of steel tubes and aluminum fins spaced approximately 10-1/2 fins per inch
- Painted tubing heat exchanger and aluminum fins
- Hot water applications
- Fan/Motor Assembly includes galvanized fan guard
- Vertical or horizontal configuration
- Cabinet and louvers constructed of galvanized pre-painted steel
- Cabinet held together by shake-proof screws and molded corner sections
- Spring mounted horizontal louvers
- 115/60 single phase, two speed motor (field adjustable)
- Manufactured in an ISO 9001 registered facility

FACTORY INSTALLED OPTIONS

- Heat exchanger composed of 0.03" (Copper) / 0.04" (Steel), .867" O.D copper tubes and aluminum fins spaced approximately 10-1/2 fins per inch
- Up to 145 psi steam applications with copper tubing

FIELD INSTALLED OPTIONS

- Vertical louvers for better air distribution - vertical or horizontal discharge
- Airflow induction louvers increase airflow and throw - horizontal discharge
- Light duty, or heavy duty thermostat
- Thermostat guard cover

ENGINEERING DATA

HOT WATER CAPACITIES, CALCULATIONS AND CORRECTION FACTORS

Use the following Table A & Table B to determine

1. Heating Capacity (MBH)
2. Leaving Air Temperature (LAT)
3. Water Flow in Gallons per Minute (GPM)
4. Water Pressure Drop (WPD) in feet of water

The performances reflected in these tables are based on the following:

- Entering Water Temperature (EWT): 200°F (93°C)
- Water Temperature Drop (WTD): 20° (11°C)
- Entering Air Temperature (EAT): 60° (16°C)

TABLE A - LOW SPEED FAN SETTING

Size	Approximate Fan rpm	MBH Output	Leaving Air Temp. (LAT)		Water Flow		WPD feet of water	Air Volume	
			°F	°C	Gal. per Minute	Liters per Minute		cfm	(m³/hr)
18/24	1,100	13	104°	40°	1.31	4.96	0.06	270	459
23/33	1,100	17	107°	42°	1.72	6.49	0.01	330	561
44/62	1,100	32	113°	45°	3.23	12.22	0.08	560	952

MBH Correction Factor	0.80	0.89	0.96	1.00	1.04	1.07	1.10

* Calculate % of Water Flow by dividing actual water flow in GPM by the "cataloged" water flow.

ENGINEERING DATA continued

HOT WATER CAPACITIES, CALCULATIONS AND CORRECTION FACTORS continued

The heating output of any particular installation is a function of many different factors. It is very seldom that any installation will exactly match the conditions described in the tables on the previous page. For those installations, correction factors must be used to determine heating output and other values.

Below is an example of conditions different from those given in TABLE A and B on the previous page. Following are procedures for determining heating output and other values at conditions other than “cataloged” conditions.

Example:

Unit	Reznor Model 23/33
Entering Water Temperature (EWT)	160°F
Entering Air Temperature (EAT)	40°F
Water Temperature Drop (WTD)	10°F

I.	In TABLE B find the Heating Capacity for “catalog” conditions with High Speed Fan Setting	24,000 BTUH
II.	Determine Heating Capacity for EWT at 160°F and EAT of 40°F	24,000 BUTH x 0.846 = 20,304 BTUH
	Find the correction factor in TABLE C that satisfies the conditions listed. In this instance, it is 0.846. Multiply original BTUH output by the correction factor.	
III.	Determine Heating Capacity for WTD of 10°F	20,304 BTUH x 1.15 = 23,350 BTUH
	Find the correction factor in TABLE D that satisfies the conditions listed. In this instance it is 1.15. Multiply BTUH output by the correction factor.	
IV.	Determine Gallons per Minute (GPM) at 200°F EWT, 60°F EAT, but with WTD of 10°F	2.42 GPM
	Find the GPM from TABLE B for “catalog” conditions with High speed Fan Setting	
	In TABLE D find the GPM Correction Factor for WTD of 10°F. In this case it is 2.30. Multiply original GPM by the correction factor.	2.42 GPM x 2.30 = 5.57 GPM
	Note: This formula applies only to units with 200°F EWT and 60°F EAT. For all other applications, use the formula shown (right):	GPM = BTUH ÷ (500 x WTD)
	Determine GPM for installation described in step III above at 10°F	23350 ÷ (500 x 10°F WTD) = 4.67 GPM
V.	Determine Water Pressure Drop (WPD) in Feet of Water at 10°F WTD	4.67 GPM
	Find the GPM from step IV above	
	On the Heat Exchanger Resistance Chart on page 6, find the WPD at 4.67 GPM on the left side axis. Follow it until it meets the line for Model WS23/33. From that point, follow the line down to the bottom axis to determine the WPD at 176°F mean water temperature.	0.14 FT H ₂ O (as marked)
	Determine the Correction Factor (K). The above example started with an EWT of 160°F and WTD of 10°F. That would result in water temperature at 150°F as it leaves the heater. Find the mean (average water temperature).	(160°F + 150°F) ÷ 2 = 155°F
	Find the Correction Factor (K) for the value nearest 155°F. At 158°F the Correction Factor (K) is 1.05. Multiply 1.05 by the WPD found on the chart 0.14 FT H ₂ O.	0.14 FT H ₂ O x 1.05 = 0.147 FT H ₂ O
VI.	Determine Heating Capacity for water flow rate of 3.03 GPM	24,000 BUTH
	Determine the Heating Capacity from TABLE B for “catalog” conditions with High Speed Fan Setting	
	Divide actual flow rate in GPM by cataloged flow rate found in TABLE B.	3.03 GPM ÷ 2.42 GPM = 125%
	In TABLE E find the MBH Correction Factor for a flow rate of 125%. In this case it is 1.04. Multiply original MBH by the correction factor.	24,000 BTUH x 1.04 = 24,960 BTUH
VII.	Determine Leaving Air Temperature (LAT) using the formula shown (right):	LAT = EAT+ BTUH ÷ (CFM x 1.085)
	In TABLE B find the Air Volume (cfm) for “cataloged” model and apply it conditions described in Step III above.	40°F + (23,350 BTUH ÷ (500 cfm x 1.085)) = 83°F

To obtain Pressure Loss Feet of water for other GPM see the graphic data on page 9.

HEAT EXCHANGER RESISTANCE CHART

The following table indicates the Water Pressure Drop (WPD) in FT H₂O for each model for a mean water temperature of 176°F (80°C)

- Mean water temperature - °F, °C
- Correction Factor - K

°C	°F	K
50	122	1.15
60	140	1.10
70	158	1.05
80	176	1.00
90	194	0.95
100	212	0.89
110	230	0.83
120	248	0.78
130	266	0.72
140	284	0.67
150	302	0.61

TERMS, ABBREVIATIONS AND FORMULAS

Following is a list of terms, abbreviations and formulas to assist in specifying the correct size hydronic heating equipment for a specific application. All terms and abbreviations apply to both steam and hot water heating unless otherwise noted.

ATR	Air Temperature Rise - The difference between the Entering Air Temperature (EAT) and the Leaving Air Temperature (LAT) due to the amount of heat added.
BTUH	British Thermal Units per Hour - The common measure of heating output or capacity.
CFM	Cubic Feet per Minute - The volume of air moved through the heater.
COND	Condensate - The amount of water that results from removing heat from steam, measured in Pounds per Hour (lb/hr) - steam heat only.
EAT	Entering Air Temperature - The temperature of the air just before it passes through the heat exchanger.
EDR	Equivalent Direct Radiation - A measure of heat output measured in square feet - steam heat only.
EWT	Entering Water Temperature - The temperature of the water as it enters the heat exchanger - hot water heat only.
FPM	Feet Per Minute - The measure of the velocity of air as it leaves the heater.
GPM	Gallons Per Minute - The measure of the flow of water that passes through the heat exchanger - hot water heat only.
L	Latent heat of steam - steam heat only.
LAT	Leaving Air Temperature - The temperature of the heated air just after it passes through the heat exchanger.
LWT	Leaving Water Temperature - The temperature of the water as it leaves the heat exchanger - hot water heat only.
MBH	One thousand BTUH
PSI	Pounds per Square Inch - The measure of the pressure of steam in pipes - steam heat only.
RPM	Rotations Per Minute - The number of rotations the fan will make in one minute.
WPD	Water Pressure Drop - The resistance to the flow of water through a system created by friction between the water and piping - hot water heat only.
WTD	Water Temperature Drop - The difference between the Entering Water Temperature (EWT) and the Leaving Water Temperature (LWT) due to the amount of heat removed - hot water heat only.

$$\begin{aligned} \text{ATR} &= \text{BTUH} \div (\text{CFM} \times 1.08) \\ \text{LAT} &= \text{EAT} + \text{ATR} \\ \text{GPM} &= \text{BTUH} \div (\text{WTD} \times 500) \\ \text{WTD} &= \text{BTUH} \div (\text{GPM} \times 500) \\ \text{COND} &= \text{BTUH} \div L \\ \text{COND} &= \text{EDR} \div 4 \\ \text{EDR} &= \text{BTUH} \div 240 \text{ (at 2 psi only)} \end{aligned}$$

STEAM CAPACITIES, CALCULATIONS AND CORRECTION FACTORS

Use the following two tables to determine

1. Heating Capacity (MBH)
2. Leaving Air Temperature (LAT)
3. Condensate of water in lbs./hr.
4. Heat output measured in square feet of Equivalent

Direct Radiation:

1 ft2 EDR = 240 BTUH at 2 psi steam

The performances reflected in these tables are based on the following:

- Steam pressure: 2 Pounds per Square Inch (psi)
- Entering Air Temperature (EAT): 60° (16°C)

TABLE A - LOW SPEED FAN SETTING

Size	Approximate Fan rpm	MBH Output	Leaving Air Temperature (LAT)		Cond. Lbs/hr	Sq. Ft. EDR
			°F	°C		
18/24	1,100	18	121°	50°	19	75
23/33	1,100	23	124°	51°	24	96
44/62	1,100	44	132°	56°	46	183
60/85	1,100	60	129°	54°	62	250
78/110	1,100	78	125°	52°	81	325
96/120	850	96	134°	57°	99	400
140/175	850	140	134°	57°	145	583
190/238	850	190	140°	60°	197	792
300/350	850	300	133°	56°	310	1,250

TABLE B - HIGH SPEED FAN SETTING

Size	Approximate Fan rpm	MBH Output	Leaving Air Temperature (LAT)		Cond. Lbs/hr	Sq. Ft. EDR
			°F	°C		
18/24	1,550	24	115°	46°	25	100
23/33	1,600	33	121°	49°	34	138
44/62	1,600	62	126°	52°	64	258
60/85	1,600	85	123°	50°	88	354
78/110	1,600	110	121°	50°	114	458
96/120	1,080	120	131°	55°	124	500
140/175	1,080	175	130°	55°	181	729
190/238	1,080	238	137°	58°	246	992
300/350	1,080	350	128°	53°	362	1,458

TABLE C - STEAM CORRECTION FACTORS FOR STEAM PRESSURE AND EAT DIFFERENT FROM CATALOGED INFORMATION

Entering Air Temperature (EAT)		Steam Pressure - psi (saturated)												
		0	2	5	10	15	20	30	40	50	75	100	125	150

TOTAL HEAT OF STEAM BTUH	1150.4	1151.6	1152.8	1154.9	1156.3	1158.6	1160.2	1163.7	1169.2	1178.4	1184.4	1188.8	1192.2

The heating output of any particular installation is a function of many different factors. It is very seldom that any installation will exactly match the conditions described in the tables on the previous page. For those installations, correction factors must be used to determine heating output and other values.

Below is an example of conditions different from those given in TABLE A and B on the previous page. Following are procedures for determining heating output and other values at conditions other than "cataloged" conditions.

Example:

Unit	Reznor Model 23/33
Steam Pressure	10 psi
Entering Air Temperature (EAT)	40°F

I.	In TABLE B find the Heating Capacity for "catalog" conditions with High Speed Fan Setting	33,000 BTUH
II.	Determine Heating Capacity for steam pressure of 10 psi and EAT of 40°F	33,000 BUTH x 1.290 = 42,570 BTUH
	Find the conversion factor in TABLE C that satisfies the conditions listed. In this instance, it is 1.290. Multiply original BTUH output by the conversion factor.	
III.	Determine Leaving Air Temperature (LAT) using the formula shown (right):	$LAT = EAT + BTUH \div (CFM \times 1.085)$
	In TABLE B find the Air Volume (cfm) for "cataloged" model and apply it conditions described in Step II above.	$40^{\circ}F + (42,570 \text{ BTUH} \div (500 \text{ cfm} \times 1.085)) = 118^{\circ}F$
IV.	Determine the condensate in pounds per hour (lbs/hr).	$42,570 \text{ BTUH} \div 952.5 = 44.7 \text{ lbs/hr of condensate}$
	Divide the heating output by the Latent Heat of steam found in TABLE D at 10psi. In this case it is 952.5.	
V.	Determine the Equivalent Direct Radiation (EDR) in square feet based on conditions in step IV using the formula shown (right):	$EDR = 4 \times \text{condensate (lbs/hr)}$
		$4 \times 44.7 \text{ lbs/hr} = 179 \text{ sq. ft. EDR}$

EFFECTIVE HEAT COVER AND AIR THROW

Size	Fan Motor	Horizontal Discharge				Vertical Discharge			
		Max Mounting Height		Throw		Max Mounting Height		Cover ①

OPTIONAL VERTICAL LOUVERS

Vertical Louvers can be used with units installed for either horizontal or vertical discharge, but they are recommended for vertical discharge units to create a 4 way discharge pattern.

Size	A	B
18/24	12-1/2 (318)	11-1/8 (282)
23/33	12-1/2 (318)	11-1/8 (282)

190/238	25-1/4 (642)	23-7/8 (606)
300/350	31-1/2 (800)	30-1/6 (764)

OPTIONAL AIRFLOW INDUCTION OPTIMIZER

Greatly increase the throw of horizontal discharge units.

The Airflow Induction Optimizer increases the throw for Reznor Models WS. This increased flow results in energy savings and better environmental control. This option increases the air speed thanks to the unique shape of the deflecting louvers which create layers of hot air at the unit outlet.

The space created between layers causes air around the front of the unit to be drawn into the air stream and mixed with the heated air. The result is a lower leaving air temperature and a significant increase in the air throw.

Size	A
18/24	12-3/8 (314)
23/33	12-3/8 (314)
44/62	14-1/2 (368)
60/85	16-5/8 (422)
78/110	18-3/4 (476)
96/120	20-7/8 (530)
140/175	23 (584)
190/238	25-1/8 (638)

All dimensions given in inches and (mm).

REZNOR®

OPTIONAL AIRFLOW INDUCTION OPTIMIZER continued

WITHOUT THE OPTIONAL AIRFLOW INDUCTION OPTIMIZER AIRFLOW AND THROW ARE GOOD.

The leaving air temperature from the units has a decisive influence on hot air stratification and consequently on energy saving: for every 2°F (1°C) increase in temperature there is a 1.5% increase in energy consumption.

The use of the Airflow Induction Optimizer has the following advantages:

a) Energy Saving

- Reduced hot air stratification within the building
- Reduced operating time of the units with the same ambient temperature

Energy savings vary by region and other variables, but average savings can be between a minimum of 5% and a maximum of 15%. In many applications, payback is within two heating seasons.

b) Environmental Comfort

- Increased floor temperature uniformity with greater comfort area
- Possibility to install smaller and quieter units, due to increase of throw

With the Optional Airflow Induction Optimizer airflow and throw are better.

REZNOR®

OPTIONAL AIRFLOW INDUCTION OPTIMIZER continued

INCREASE IN THROW WITH THE OPTIONAL AIRFLOW INDUCTION OPTIMIZER IN FEET (METERS)

Size	Maximum Throw without Optimizer		Maximum Throw with Optimizer
